Aggregate indicators

Minimum dataset approach SMART indicators

<u>Early digitisation</u> (administrative data biased)

- Patient registration
- High throughput systems
 - Lab, pharmacy
- Electronic registers
- Hospital d/c summaries

EMRs

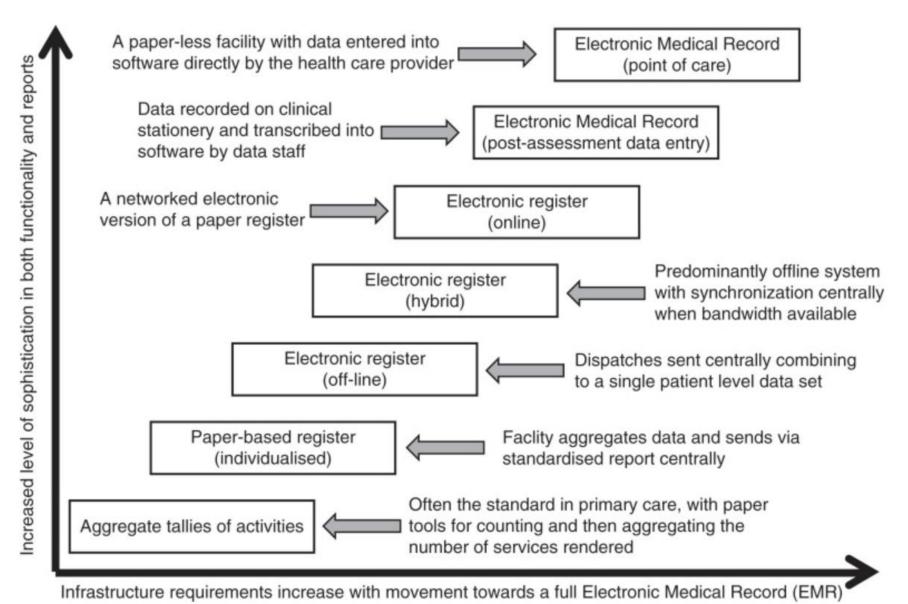

- Single-sign-on
- Integrated or seamless best of breed systems
- Decision support
- etc

Second generation routine health information systems

1 st generation routine HIS	2 nd generation routine HIS
District Health Management Information System	Personal health records and health intelligence
Aggregate data and indicators	Person-level data, and indicators aggregated from unit data
Minimum dataset approach and information pyramid, rigorous interrogation of indicator selection	Person-centric administrative and clinical data required for delivering care
Dedicated data collection tools for tallying elements unrelated to patient care	Data collection embedded in clinical records
DHIS (aggregate data system) the primary management tool	Consolidated data environment for person level data with health data science capacity to derive value

Evolution of electronic medical records in high burden African settings

The registry or health information exchange model

South African Health Normative Standards Framework as an HIE model

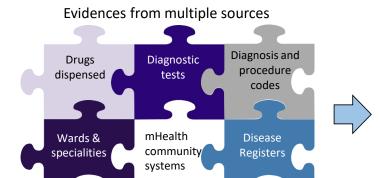

Western Cape context: Unique health ID and maturing administrative systems

Western Cape Provincial Health Data Centre

Phenotype algorithms using all available data

Categorised based on specificity to data point of interest

Outcome	Evidence of an outcome for the episode
High confidence	Strong enough evidence to start an episode
Weak-Moderate evidence	Able to start an episode, however more evidence is required to improve
Supporting only	Can only be appended to existing episode but not start one

Patient example for a single pregnancy

Evidence	Source	Category	Date
Rhesus antibody test performed	Labs	High confidence	2015-01-23
Iron & Folate dispensed	Drugs	Supporting	2015-04-03
Has live birth record	Birth register	Outcome	2015-06-16
Has diagnosis code indicating live birth	Diagnosis codes	Weak-Moderate	2015-06-16

Pregnancy episode

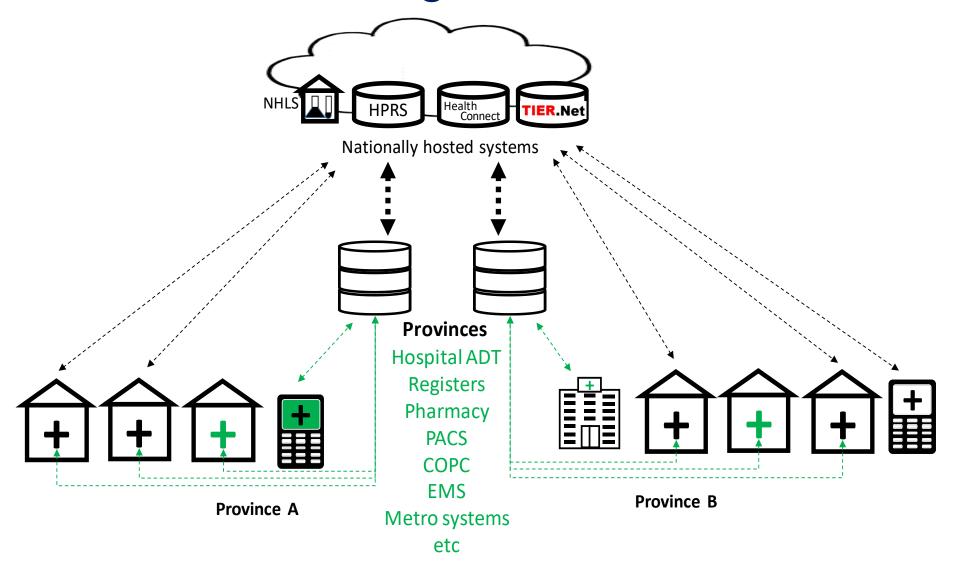

Patient	Preg. number	Start End Last Date Date Contact		Last Contact	Evidence list	End date evidence list	Facility	Confidence	
XXX	1		2015- 06-16	2015- 06-16	Birth Record, Diagnosis code, Rhesus Test, Iron & Folate	Birth Record, Diagnosis code	Hosp A	0.95 → High confidence	

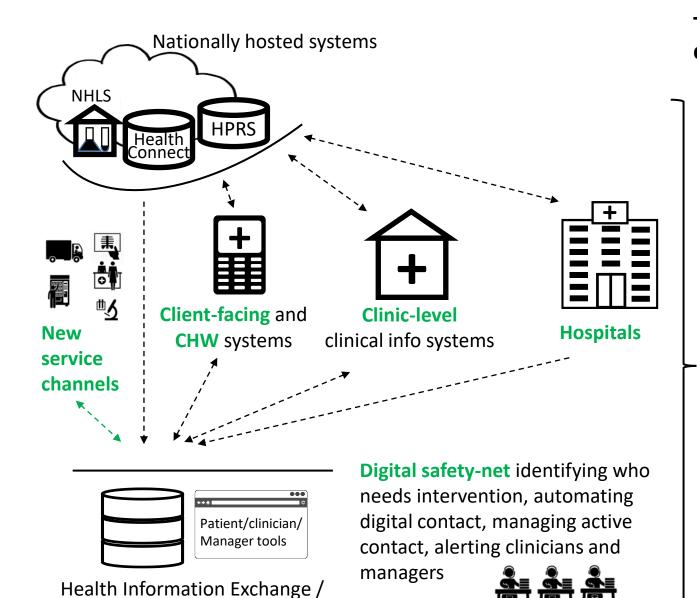

Cascade built by combining episodes with attributes, comorbidities and health observations of interest

Maternal cascade

First	Out-	Estimated	Infant	Delivery			Infant HIV	Con-	Co-	Evidence list	Facility	Con-
evidence	come	gestational	Out-	method	Wt.	HIV	status	genital	morbidities			fidence
date	date	age	come			status		anomaly				
2015-	2015-	40 weeks	Live	Vaginal	2800g	On ART	Negative	None	Diabetes	Birth Record, Diagnosis code,	Hosp A	High
01-23	06-16		birth	delivery		(2012)	(2016)		(2011)	Rhesus Test, Iron & Folate		

Data flow generalisation

Transforming chronic disease care through data consolidation of person-level health data

Interfacing with **patients**, **CHWs**, **clinicians** and **managers**, to improve the quality and continuity of clinical care provision

by

- Using digital safety-nets and direct interactions with patients (automated and through a contact centre) to enable new care delivery approaches
- Supporting new digitally-supported service delivery channels (eg. logistics hubs, physical or virtual) partnering with industry
- Applying modern data science approaches to population-wide consolidated data to intelligently support clinical care, service management and digital patient interactions
- Leveraging patient autonomy and agency through client-facing solutions which support adherence, self-management and differentiated care

Provincial Health Data Centre

Where to prioritise?

Client registry / provider registry / facility registry

These are core underlying systems

Quick wins

- Hospitals electronic discharge summaries
- Laboratories digitise
- Primary care
 - Integrated stationery
 - Single digitisation moment regsitry
 - Initially replicate the integrated stationery with printed outputs
 - Dispensing data in larger facilities high throughput areas

Centrally

Ensure everything routes through the exchange

Integrated clinical stationery
